

FLEXIBLE HOSE FLOATS

HDS FHF3 – flexible hose floats with buckle.

HDS-FHF3: Hose Floats have been specifically designed to improve not only the visibility and buoyancy of the unit, but also the method of fixing and securing the float to the flexible hose. The use of round, buoyancy material, instead of square, ensures a snug and better surface contact to the hose.

Greater Visibility

To enhance the visibility of the float, two fluorescent stripes have been sewn onto the outer surface of the 'Dayglow Orange' material. Ideal for night operations, or restricted light and in bad weather conditions.

Securing to the Hose

To secure the floats to the flexible hose, various methods are available.

1. Two internal straps complete with adjustable plastic buckles are sewn onto the inner surface of the float.
2. A further set of straps and buckles are sewn onto the outside material, again with adjustable plastic buckles. These fully encapsulate the inner buckles and resist any movement of the float along the length of the hose.
3. Tie cords are sewn into each end of the float, which ensures there will be no movement once the float has been positioned.

Diameter (of hose)	Length (Along hose)	Nett Buoyancy Weight
2" (50 mm)	660mm	9kg
3" (75 mm)	660mm	12kg
4" (100mm)	660mm	17kg
5" (125mm)	750mm	28kg
6" (150mm)	750mm	32kg
